

## MECHANICS OF SOLIDS

<b>III Semester: ME</b>								
Course Code	Category	Hours / Week			Credits	Maximum Marks		
AME004	Core	L	T	P	C	CIA	SEE	Total
		3	1	-	4	30	70	100
<b>Contact Classes: 45</b>		<b>Tutorial Classes: 15</b>		<b>Practical Classes: Nil</b>			<b>Total Classes: 60</b>	
<p><b>OBJECTIVES:</b></p> <p><b>The course should enable the students to:</b></p> <p>I. To solve real field problems through evaluating the relationship between stress and strain.</p> <p>II. To understand the shear force and bending moment diagrams of symmetrical beams.</p> <p>III. To determine bending and shear stresses developed in beams of various sections</p> <p>IV. To understand various theories of failure, mohr's circle of stresses, principle stresses and strains.</p> <p>V. To understand and apply the concept of stress and strain to analyze and design structural members and machine parts under axial load, shear load, bending moment and torsion.</p> <p><b>COURSE LEARNING OUTCOMES (CLOs):</b></p> <ol style="list-style-type: none"> <li>1. Demonstrate the statically determinate and indeterminate problems. Use algebraic equations to determine the effect of stress and strain in the bars which are made up of various materials.</li> <li>2. Understand extension and reduction of length of different bars. Explain the various stresses and strains and their relations, also comprehend the importance of elastic moduli.</li> <li>3. Explore the shear force diagrams under various loads. Explain the importance of beams in the real field by understanding the types of loads.</li> <li>4. Comprehend bending moment and its variation at various loads. Explain the bending moment diagram and its importance, understanding the supports and beams.</li> <li>5. Determine the resistance and deformation in members which are subjected to axial, flexural and torsional loads.</li> <li>6. Evaluate the principal stresses, strains and apply the concept of failure theories for design of shafts and other designed products.</li> <li>7. Able to calculate the shear stresses developed in various sections of beams.</li> <li>8. Capable of understand the loads which occur in crash analysis.</li> <li>9. Understand the effect of gradual loads on the various materials.</li> <li>10. Understand torsion equation</li> <li>11. Able to calculate the flexural developed in various sections of beams of real field problems.</li> <li>12. Find principle stresses and strains and to apply theories of failure in the design of various mechanical parts.</li> <li>13. Determine stresses developed in a shaft and design of a shaft.</li> <li>14. Derive the expression for Longitudinal stress</li> <li>15. Derive the expression for volumetric strain</li> <li>16. Find the volumetric strain of a thin spherical shell</li> <li>17. Derive the expression for Hoop stress.</li> <li>18. Understand the real field problems of various pressure vessels which are made up of different materials.</li> <li>19. Able to design the thin vessels which are subjected to different stresses.</li> <li>20. Explore the use of modern engineering tools, software and equipment to prepare for competitive exams, higher studies etc</li> </ol>								
<b>UNIT I</b>	<b>SIMPLE STRESSES AND STRAINS</b>						<b>Classes: 09</b>	
Elasticity and plasticity – Types of stresses & strains–Hooke's law– stress – strain diagram for mild steel – Working stress – Factor of safety – Lateral strain, Poisson's ratio & volumetric strain – Elastic moduli & the relationship between them – Bars of varying section – composite bars – Temperature stresses. Strain energy – Resilience – Gradual, sudden, impact and shock loadings.								
<b>UNIT II</b>	<b>SHEAR FORCE AND BENDING MOMENT DIAGRAMS</b>						<b>Classes: 09</b>	
Definition of beam – Types of beams – Concept of shear force and bending moment – S.F and B.M diagrams for cantilever, simply supported and overhanging beams subjected to point loads, u.d.l., uniformly varying loads and combination of these loads – Point of contra flexure – Relation between S.F., B.M and rate of loading at a section								

<b>UNIT III</b>	<b>FLEXURAL STRESSES, SHEAR STRESSES</b>	<b>Classes: 09</b>
<p>Theory of simple bending – Assumptions – Derivation of bending equation: <math>M/I = f/y = E/R</math> Neutral axis– Determination bending stresses – section modulus of rectangular and circular sections (Solid and Hollow), I, T, Angle and Channel sections – Design of simple beam sections.</p> <p>Shear Stresses: Derivation of formula – Shear stress distribution across various beams sections like rectangular, circular, triangular, I, T angle sections. Steering gears: Conditions for correct steering, Davis Steering gear, Ackerman’s steering gear, Hooke’s joint: Single and double Hooke’s joint, velocity ratio, application, problems.</p>		
<b>UNIT IV</b>	<b>PRINCIPAL STRESSES AND STRAINS, THEORIES OF FAILURE</b>	<b>Classes: 09</b>
<p>Introduction – Stresses on an inclined section of a bar under axial loading – compound stresses – Normal and tangential stresses on an inclined plane for biaxial stresses – Two perpendicular normal stresses accompanied by a state of simple shear – Mohr’s circle of stresses – Principal stresses and strains – Analytical and graphical solutions. Theories of Failure: Introduction – Various theories of failure - Maximum Principal Stress Theory, Maximum Principal Strain Theory, Strain Energy and Shear Strain Energy Theory (Von Mises Theory)..</p>		
<b>UNIT V</b>	<b>DESIGN OF CIRCULAR SHAFTS AND STRESSES IN PRESSURE VESSELS</b>	<b>Classes: 09</b>
<p>Theory of pure torsion – Derivation of Torsion equations : <math>T/J = q/r = N\theta/L</math> – Assumptions made in the theory of pure torsion – Torsional moment of resistance – Polar section modulus – Power transmitted by shafts – Combined bending and torsion and end thrust – Design of shafts according to theories of failure. Thin Cylinders: Thin seamless cylindrical shells – Derivation of formula for longitudinal and circumferential stresses– hoop, longitudinal and Volumetric strains – changes in dia, and volume of thin cylinders– Thin spherical shells..</p>
