I. COURSE OVERVIEW:

This course emphasizes on basic knowledge of various types of operating systems, effective resource utilization by using systems and applications software. It is designed to provide in-depth critique on the problems of resource management, scheduling, concurrency, synchronization, memory management, file management, protection and security of used system. Learned knowledge will be implemented in design and development of hybrid operating systems, command control systems, and in real time environments.

II. OBJECTIVES:

The course should enable the students to:

- The principles of operating systems, services and functionalities with its evolution. Ι
- Π The structures, functions and components of modern operating systems
- III The conventional hardware at different OS abstraction levels.
- The essential skills to examine issues and methods employed in design of operating systems with IV identification of various functionalities.

III. COURSE OUTCOMES:

After successful completion of the course, students should be able to:

CO 1	Illustrate different architectures used in design of modernoperating systems.	Understand
CO 2	Solve problems related to process scheduling, synchronization and deadlock handling in unit and multi-processing systems.	Apply
CO 3	Choose memory allocation algorithms for effective utilization of resources.	Apply
CO 4	Select various page replacement algorithms applied forallocation of frames.	Apply
CO 5	Make use of different file allocation and disk scheduling algorithms applied for efficient utilization of storage.	Apply
CO 6	Outline mechanisms used in protection of resources in real timeenvironment	Understand
IV. SYI	LLABUS:	

UNIT-I INTRODUCTION

Classes: 10

Operating systems objectives and functions: Computer system architecture, operating systems structure, operating systems operations; Evolution of operating systems: Simple batch, multi programmed, time shared, personal computer, parallel distributed systems, real time systems, special purpose systems, operating system services, user operating systems interface; Systems calls: Types of systems calls, system programs, protection and security, operating system design and implementation, operating systems structure, virtual machines.

UNIT-II PROCESS AND CPU SCHEDULING, PROCESS COORDINATION Classes
--

Process concepts: The process, process state, process control block, threads; Process scheduling: Scheduling queues, schedulers, context switch, preemptive scheduling, dispatcher, scheduling criteria, scheduling algorithms, multiple processor scheduling; Real time scheduling; Thread scheduling; Case studies Linux windows; Process synchronization, the critical section problem; Peterson's solution, synchronization hardware, semaphores and classic problems of synchronization, monitors.

UNIT-III	MEMORY MANAGEMENT AND VIRTUAL MEMORY	Classes: 08				
Logical and physical address space: Swapping, contiguous memory allocation, paging, structure of page table.						
Segmentation: Segmentation with paging, virtual memory, demand paging; Performance of demand paging: Page replacement, page replacement algorithms, allocation of frames, thrashing.						
UNIT-IV	FILE SYSTEM INTERFACE, MASS-STORAGE STRUCTURE	Classes: 09				
The concept of a file, access methods, directory structure, file system mounting, file sharing, protection, file system structure, file system implementation, allocation methods, free space management, directory implementation, efficiency and performance; Overview of mass storage structure: Disk structure, disk attachment, disk scheduling, disk management, swap space management; Dynamic memory allocation: Basic concepts; Library functions.						
UNIT-V	DEADLOCKS, PROTECTION	Classes: 08				
System model: Deadlock characterization, methods of handling deadlocks, deadlock prevention, dead lock avoidance, dead lock detection and recovery form deadlock system protection, goals of protection, principles of protection, domain of protection, access matrix, implementation of access matrix, access control, revocation of access rights, capability based systems, language based protection.
