<p><b>I. COURSE OVERVIEW:</b>            Stochastic or random processes are mathematical objects defined on probability space. The study of these processes is of primary importance in all science and engineering specializations. This course comprises two parts. The first part introduces the fundamental principles of probability theory and random variables necessary to understand the stochastic processes. The second part introduces the basic concepts of random processes, random signals, and their interaction with the electrical or electronic systems. The course forms the basis for the next level courses of an electronics engineer such as analog communication, digital communication and digital signal processing, radar systems and digital image processing. It is also useful for a data science engineer in designing the machine learning algorithms.</p> <p><b>II. OBJECTIVES:</b>  <b>The course should enable the students to:</b></p> <ul style="list-style-type: none"> <li>I The fundamental concepts of the 1-dimensional and 2-dimensional random variables and their characterization in probability space.</li> <li>II The stationary random process, its framework and application for analyzing random signals and noises.</li> <li>III The characteristics of 1-dimensional stationary random signals in time and frequency domains.</li> <li>IV Analysis of the response of a linear time invariant (LTI) system driven by 1-dimensional stationary random signals useful for subsequent design and analysis of communication systems.</li> </ul> <p><b>III. COURSE OUTCOMES:</b>  <b>After successful completion of the course, students should be able to:</b></p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 10%;">CO 1</td> <td style="width: 70%;">Infer the concepts of the random experiment, event probability, joint event probability, and conditional event probability for proving the Bayes theorem and for computing complex event probabilities and independence of multiple events.</td> <td style="width: 20%;">Understand</td> </tr> <tr> <td>CO 2</td> <td>Explain the concept of random variable, the probability distribution function, probability density function and operations on single random variable to analytically derive the moments.</td> <td>Understand</td> </tr> <tr> <td>CO 3</td> <td>Develop joint distribution, density function, expectation operator and transformations for multiple random variables using the concept of single random variable.</td> <td>Apply</td> </tr> <tr> <td>CO 4</td> <td>Extend the random variable concept to random process and its sample functions for demonstrating the time domain and frequency domain characteristics.</td> <td>Understand</td> </tr> <tr> <td>CO 5</td> <td>Develop analytically the auto-power and cross-power spectral densities to solve the related problems of random processes using correlation functions and the Fourier transform.</td> <td>Apply</td> </tr> <tr> <td>CO 6</td> <td>Analyze the response of a linear time invariant (LTI) system driven by stationary random processes using the time domain and frequency domain description of random processes.</td> <td>Analyze</td> </tr> </table> <p><b>IV. SYLLABUS:</b></p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 15%; text-align: center; color: blue;"><b>UNIT-I</b></td> <td style="width: 60%; text-align: center; color: blue;"><b>PROBABILITY AND RANDOM VARIABLE</b></td> <td style="width: 25%; text-align: center; color: blue;"><b>Classes:08</b></td> </tr> </table> <p>Introduction to probability through sets and probability: Relative frequency; Experiments and sample spaces, discrete and continuous sample spaces; Events; Probability definitions and axioms; Mathematical model of experiments; Probability as a relative frequency; Joint probability; Conditional probability, total probability; Baye's theorem and independent events. Random variable: Definition of random variable, conditions for a function to be a random variable, discrete, continuous and mixed random variable.</p>									CO 1	Infer the concepts of the random experiment, event probability, joint event probability, and conditional event probability for proving the Bayes theorem and for computing complex event probabilities and independence of multiple events.	Understand	CO 2	Explain the concept of random variable, the probability distribution function, probability density function and operations on single random variable to analytically derive the moments.	Understand	CO 3	Develop joint distribution, density function, expectation operator and transformations for multiple random variables using the concept of single random variable.	Apply	CO 4	Extend the random variable concept to random process and its sample functions for demonstrating the time domain and frequency domain characteristics.	Understand	CO 5	Develop analytically the auto-power and cross-power spectral densities to solve the related problems of random processes using correlation functions and the Fourier transform.	Apply	CO 6	Analyze the response of a linear time invariant (LTI) system driven by stationary random processes using the time domain and frequency domain description of random processes.	Analyze	<b>UNIT-I</b>	<b>PROBABILITY AND RANDOM VARIABLE</b>	<b>Classes:08</b>
CO 1	Infer the concepts of the random experiment, event probability, joint event probability, and conditional event probability for proving the Bayes theorem and for computing complex event probabilities and independence of multiple events.	Understand																											
CO 2	Explain the concept of random variable, the probability distribution function, probability density function and operations on single random variable to analytically derive the moments.	Understand																											
CO 3	Develop joint distribution, density function, expectation operator and transformations for multiple random variables using the concept of single random variable.	Apply																											
CO 4	Extend the random variable concept to random process and its sample functions for demonstrating the time domain and frequency domain characteristics.	Understand																											
CO 5	Develop analytically the auto-power and cross-power spectral densities to solve the related problems of random processes using correlation functions and the Fourier transform.	Apply																											
CO 6	Analyze the response of a linear time invariant (LTI) system driven by stationary random processes using the time domain and frequency domain description of random processes.	Analyze																											
<b>UNIT-I</b>	<b>PROBABILITY AND RANDOM VARIABLE</b>	<b>Classes:08</b>																											

<b>UNIT-II</b>	<b>DISTRIBUTION AND DENSITY FUNCTIONS</b>	<b>Classes:10</b>
<p>Distribution and density functions: Distribution and density functions definitions and properties; Binomial, Poisson, Uniform, Gaussian, Exponential, Rayleigh, Conditional distribution, methods of defining conditioning on an event, conditional density, properties. Operation on one random variable expectations: Introduction, expected value of a random variable, function of a random variable, moments about the origin, central moments, variance and skew; Chebychev's inequality; Characteristic function; Moment generating function; Transformations of a random variable: Monotonic transformations for a continuous random variable; Non monotonic transformations of continuous random variable; Transformation of a discrete random variable.</p>		
<b>UNIT-III</b>	<b>MULTIPLE RANDOM VARIABLES AND OPERATIONS</b>	<b>Classes: 08</b>
<p>Multiple random variables: Vector random variables, joint distribution function, properties of joint distribution; Marginal distribution functions, conditional distribution and density: Point conditioning, conditional distribution and density: Interval conditioning, statistical independence, sum of two random variables, sum of several random variables; Central limit theorem.</p> <p>Operations on multiple random variables: Expected value of functions of random variables: Joint moments about the origin, joint central moments, joint characteristic functions and jointly Gaussian random variables: Two random variables case and N random variable case, properties; Transformations of multiple random variables; Linear transformations of Gaussian random variables.</p>		
<b>UNIT-IV</b>	<b>STOCHASTIC PROCESSES: TEMPORAL CHARACTERISTICS</b>	<b>Classes: 10</b>
<p>The random process concept, classification of processes, deterministic and non deterministic processes, distribution and density functions, concept of stationary and statistical independence; First order stationary processes; Second order and wide sense stationarity, N Order and strict sense stationarity, time averages and ergodicity, mean ergodic processes, correlation ergodic processes; Autocorrelation function and its properties; Cross correlation function and its properties; Covariance functions; Gaussian random processes; Poisson random process.</p>		
<b>UNIT-V</b>	<b>STOCHASTIC PROCESSES: SPECTRAL CHARACTERISTICS</b>	<b>Classes: 09</b>
<p>Power spectrum: Properties, relationship between power spectrum and autocorrelation function; The cross power density spectrum, properties, relationship between cross power spectrum and cross correlation function. Spectral characteristics of system response: Power density spectrum of response; cross-power density spectrums of input and output of a linear system. Introduction to white Gaussian noise process and its properties.</p>
