FINITE ELEMENT METHODS

VI Semester: ME

Course Code	Category	Hours / Week			Credits	Maximum Marks		
		L	T	P	C	CIA	SEE	Total
AMEB22	Core	2	1	-	3	30	70	100
Contact Classes: 30	Tutorial Classes: 15	Practical Classes: Nil				Total Classes: 45		

I. COURSE OUTCOMES:

The finite element analysis (FEA) is a numerical method widely used for modeling and analyzing structures. This course introduces the mathematical modeling concepts of the Finite Element Analysis for solving structural, thermal and dynamics problems that are too complicated to be solved by analytical methods.

II. OBJECTIVES:

The course should enable the students to:

I	The basic concepts of Finite Element methods and its applications to complexengineering problems.
II	The characteristics and selection of different finite elements used in finite elementmethods.
III	The equilibrium equations and stress-strain relations for different boundary conditions encountered in structural and heat transfer continuum problems.
IV	The application of the FEM technique to dynamic problems and validate the solutions through simulation software for real time applications.

III. COURSE OUTCOMES:

After successful completion of the course, students should be able to:

CO 1	**Choose** discretization concepts and shape functions of structural members for computing displacements and stresses of the aircraft components.	Apply
CO 2	**Utilize** the shape functions of truss and beam elements for obtainingstiffness matrix and load vector to compute nodal displacement, stresses.	Apply
CO 3	**Identify** the required discreet models of constant strain triangle element for estimating displacement and stress under load conditions.	Apply
CO 4	**Make use of** axe-symmetric modeling concepts to solids of revolution for stress approximation	Apply
CO 5	**Apply** numerical techniques of heat transfer problems to compute the temperature gradients under various thermal boundary conditions	Apply
CO 6	**Develop** the governing equations for the dynamic systems to estimatecircular frequency and mode shapes, in correlation with modern tools	Apply

IV. SYLLABUS:

MODULE-I	INTRODUCTION TO FEM	Classes : 09

Introduction to FEM for solving field problems. Basic equations of elasticity, Stress–Strain and strain-displacement relations for 2D-3D elastic problems. Boundary conditions. One Dimensional problem: Finite element modeling coordinates and shape functions. Assembly of Global stiffness matrix and load vector. Finite element equations - Quadratic shape functions.

MODULE-II	ANALYSIS OF TRUSSES AND BEAMS	Classes : 09

Analysis of Trusses Stiffness matrix for plane Truss Elements, stress calculations and problems Analysis of beams: Element stiffness matrix for two nodes, two degrees of freedom per node beam element and simple problems. Problems

MODULE-III	2-D ANALYSIS	Classes: 09
Finite element modeling of two dimensional stress analysis with constant strain triangles and treatment of boundary conditions. Estimation of load Vector, stresses; Finite element modeling of Axisymmetric solids subjected to Axisymmetric loading with triangular elements. Two dimensional four nodded isoparametric elements.		
MODULE-IV	**STEADY STATE HEAT TRANSFER ANALYSIS**	**Classes: 09**
Steady state Heat Transfer Analysis: 1-D Heat conduction of slab 1D fin elements, 2D heat conduction - analysis of thin plates, Analysis of a uniform shaft subjected to torsion- problems.		
MODULE-V	**DYNAMIC ANALYSIS**	**Classes : 09**
Dynamic Analysis: Dynamic equations, lumped and consistent mass matrices, eigen Values and Eigen Vectors for a stepped bar, beam; Finite element, formulation to 3D problems in stress analysis, convergence requirements, mesh generation, techniques such as semi automatic AND fully automatic use of software such as ANSYS, NISA, NASTRAN.
