

FINITE ELEMENT ANALYSIS

VI Semester: AE									
Course Code	Category	Hours / Week			Credits	Maximum Marks			
AAEC23	Core	L	T	P	C	CIA	SEE	Total	
		3	1	-	4	30	70	100	
Contact Classes: 45	Tutorial Classes: 15	Practical Classes: Nil			Total Classes: 60				
Prerequisite: Mechanics of solids									
I. COURSE OVERVIEW:									
<p>The finite element analysis (FEA) is a numerical method widely used for modeling and analyzing structures. This course introduces the mathematical modeling concepts of the Finite Element Method for solving structural, thermal and dynamics problems that are too complicated to be solved by analytical methods.</p>									
II. COURSE OBJECTIVES:									
The student will try to learn:									
<p>I. The theoretical basics of governing equations and convergence criteria of finite element method.</p> <p>II. The commercial Finite Element packages to build Finite Element models and solve a selected range of engineering problems.</p> <p>III. The approximate Finite Element Solutions for the various field problems.</p> <p>IV. The application of the FEM technique to dynamic problems and validate the solutions through simulation software for real time applications.</p>									
III. COURSE OUTCOMES:									
After successful completion of the course, students should be able to:									
CO 1	Explain the discretization concepts and shape functions of structural members for computing displacements and stresses.						Understand		
CO 2	Make use of shape functions of truss and beam elements for obtaining stiffness matrix and load vector to compute nodal displacement, stresses.						Apply		
CO 3	Apply the discrete models of CST element for estimating displacement and stress.						Apply		
CO 4	Make use of axi-symmetric modelling concepts to solids of revolution for stress approximation						Apply		
CO 5	Apply numerical techniques to heat transfer problems to compute the temperature gradients under various thermal boundary conditions						Apply		
CO 6	Develop the governing equations for the dynamic systems to estimate circular frequency and mode shapes, in correlation with modern tools						Apply		
IV. COURSE SYLLABUS:									
MODULE-I: INTRODUCTION (10)									
Introduction to Finite Element Method for solving field problems. Stress and Equilibrium. Boundary conditions. Strain - displacement relations. Stress-strain relations for 2-D and 3-D elastic problems. One Dimensional Problem: Finite element modeling coordinates and shape functions. Assembly of Global stiffness matrix and load vector. Finite element equations – Treatment of boundary conditions, Quadratic shape functions.									
MODULE –II: ANALYSIS OF TRUSSES AND BEAMS (10)									
Analysis of Trusses: Stiffness matrix for plane Truss Elements, stress calculations and problems. Analysis of beams: Element stiffness matrix for two noded, two degrees of freedom per node beam element and simple problems.									
MODULE –III: CONTINUUM ELEMENTS (09)									
Finite element modeling of two dimensional stress analysis with constant strain triangles and treatment of boundary conditions. Estimation of load vector and stresses.									
Finite element modeling of Axi-symmetric solids subjected to Axi-symmetric loading with triangular elements									
Two dimensional four noded isoparametric elements and problems.									

MODULE –IV: STEADY STATE HEAT TRANSFER ANALYSIS (09)

Steady state Heat Transfer Analysis: one dimensional analysis of slab, fin and two dimensional analysis of thin plate.

MODULE –V: DYNAMIC ANALYSIS (07)

Dynamic Analysis: Formulation of finite element model, element –Mass matrices, evaluation of Eigen values and Eigen Vectors for a stepped bar, convergence requirements, mesh generation, techniques such as semi-automatic and fully automatic use of software such as ANSYS, NISA, NASTRAN etc.

V. TEXT BOOKS:

1. Tirupathi. R. Chandrapatla, Ashok D. Belegundu, “Introduction to Finite Elements in Engineering”, Prentice Hall India, 3rd Edition, 2003.
2. Rao. S.S., “Finite Element Methods in Engineering”, Butterworth and Heinemann, 2000.
3. Reddy J.N., “An Introduction to Finite Element Method”, McGraw Hill, 2000
